

**Upstate Technical Equipment** specializes in building customized vision systems. Outsourcing specialized engineering solutions has become a necessity over the last several years as industrial and scientific imaging components have continued to advance quickly. OEMs, R&D and End Users simply do not have the budgets or time to research new components and keep up with the latest technologies. Our role is to constantly maintain relationships with the top vision vendors, stay up to date on the latest product releases and trends and become the "experts" for you. Once we have defined the core components that meet your application requirements we can then integrate everything into a turn-key solution, completely tested and ready to go!

We have built systems for medical image analysis, industrial quality control, web inspection and real-time video recording. Our design will consider all aspects of the system chain starting from the most effective illumination right through to the best choice for software.
